FreshWay — Department file: Outbound transport

Smart Logistics (EDSLOG.24) · autumn 2026

This is **your department's file**. Every department has one; you only receive your own. If you need a figure from a neighbouring department, ask them — that is what the Data Council and the Interface Agreements are for.

Alongside this file you have the **public Company dossier** (the company as a whole, the network, the cost structure, the IT landscape), which everyone has. Anything in neither document can be requested from the Executive Board with an **Information Request**; the *Board archive index* lists what exists.

Units matter. Shrink appears twice in this company: in **kilograms** against purchase volume, and in **euros** at cost. They are different numbers. Every figure below says which.

Read the KPI table with this in mind. Every KPI carries a label:

Label	Meaning
measure	not printed here on purpose — this value is in the dataset you receive in lesson 3. Measuring it is part of your work, and a department that reports its own KPI without having measured it will be asked how it knows.
N	a **norm**: what the company has set as its target. A norm is policy, not a measurement — you may argue it is wrong.
S	a **design assumption**: plausible, internally consistent, not measured. If you build a business case on it, say so.

Almost every "now" value sits below its norm. That is deliberate: a company that already meets all its targets gives you nothing to design for.

What we do. Store replenishment: two deliveries per store per day, six days a week, from three DCs to 120 stores, plus the shuttle to the EFC.

Volumes	Value	Unit
Store stops	**240**	per day

Volumes	Value	Unit
Roll cages per stop	**~26**	roll cages
Stops per route	**1.68**	
Routes	**~139** in a normal week · **193 in the peak week**	per day
Roll cages per route	**45.4** of a 66-cage **double-deck** trailer	
Average route length	70	km
Kilometres	10,360 per day · **3.23 mln per year**	km
Fleet	54 tractor units (40 euro-trailer · 10 city-trailer · 4 rigid) · 70 **double-deck** trailers, 66 roll cages each	vehicles
Electric share	15% (8 e-tractors)	
Diesel	970,000 litres per year · 30 l/100 km	
CO_2	**2,400 tonnes per year** (743 g/km, incl. refrigeration) · **S** — this is the figure we report; the kilometres in your data are the ones we actually drove, so check it	
Charging demand if fully electric	4.2 GWh/year · 1.3 kWh/km	
Time windows	06:00-11:00 and 14:00-19:00	
Stores inside a zero-emission zone	**22**	stores

KPI	Now	Target
On-time in full, DC → store	**97.2%**	98.5%
Roll cages per route	**45.4 of 66 = 69%**	**52 of 66 = 79%** · N

KPI	Now	Target
Routes with a backhaul	12%	30%
Cost per roll cage delivered	~€7.73	**€7.00** · N

Systems. TMS with board computers in all 54 tractors; planning partly manual. *What they do not do:* the route plan and the pick sequence are not linked, the TMS assumes an average unloading time that no store actually has, and position data sits in the vendor's cloud rather than in our own reporting.

People. ~59 FTE drivers (~65 headcount) plus planners; 370 driving hours per day. **Cost per unit:** outbound costs €15 mln per year = **€0.15 per case · ~€7.73 per roll cage · ~€4.64 per km**, at €100 per driving hour.

Our main problems.

1. Twenty-two of our stores sit inside a zero-emission zone with a narrow window, and that is exactly where we are late most often.
2. Our planning assumes an average unloading time that no store actually has, and we run at 45.4 roll cages on a trailer that holds 66. Two stops is often all that fits in a window, so the second deck is half empty on most routes.
3. If we electrify, 1.2 MW of charging demand lands on the CDC at the same hour — and we do not own that decision. Storage does.

What we send / receive. *From Orderpicking:* roll cages per store and window. *To Inventory & SCM:* what was actually delivered and when. *To Delivery to consumers:* shared city access, charging capacity and vehicles. **Data we hold but do not use:** planned versus actual arrival for 75,000 store deliveries a year, two years deep.

---

*Figures come from the FreshWay figure sheet. Fields marked **measure** are in the data you receive in lesson 3. The problems in the list above are real and traceable in that data; if you cannot find them, you are looking in the wrong place or joining the wrong sets — and some of them cannot be found from your own data alone.*

> **GenAI transparency.** This department file was written with Claude (Anthropic) by the course team, based on the FreshWay case design and on verified benchmark research into Dutch grocery retail. All

> figures come from a separate, source-checked figure sheet; none were generated by the model. Human-AI Agency Label: **Co-Creator**. Label source: Boetje, J., & Baake, G. (2026). *Nine prototypical human-AI agency patterns* [Figure]. figshare. https://doi.org/10.6084/m9.figshare.31706884 (CC BY 4.0).
