# Your department's agent team — the prompts you copy

**Smart Logistics (EDSLOG.24) · FreshWay · lesson 1 and the week after**

The full manual is in Dutch: *Studenthandleiding — Bouw je eigen agentteam in ChatGPT Work*, on Brightspace. It has the screenshots. **This sheet has the prompts**, in the order you use them, with one line per step saying what happens. If you read Dutch, use the manual and keep this sheet next to it for the prompts. If you do not, this sheet gets you through the exercise.

**The screenshots in the manual are in Dutch, and that is fine.** ChatGPT's interface language depends on your account, so it will differ anyway — the button positions are the same. Where a Dutch button name matters, it is given below with the English one.

> **One team per department, not one per student.** The **Data & Interface Officer** owns the folder and shares it; everyone else works in the same one. In lesson 1 you get to *the team exists and it answers*. Everything after step 3 you do in your own study time, before lesson 2.

---

## Part 1 · In lesson 1 — set it up (15 minutes)

### Step A — Open the desktop app, choose Work

Open the **ChatGPT desktop app**, not the browser. If you see an address bar with `chatgpt.com`, you are in the browser and the rest will not work. At the top there is a switch with two positions, **Chat** and **Work** (Dutch: the same). Click **Work**.

### Step B — Make one folder on your laptop

One new, empty folder. Call it `FreshWay <your department>` — for example `FreshWay Storage`. Put it in **OneDrive**, so you can share it with your department. Put nothing in it yet.

### Step C — Make a project and connect the folder

At the bottom of the window, click **Project** (Dutch: *Project*, with a folder icon) → at the bottom of the list **+ New project** (Dutch: *+ Nieuw project*). Give it a name. Then, under **Source folders** (Dutch: *Bronmappen*), click **Add folders that ChatGPT can read and edit** and select the folder from step B. Confirm, then **Create project**.

You know it worked when the folder name appears under the input field. If it is not there, the link failed — do step C again.

### Step D — The check question. Do this before you go on.

```
Name the folder you now have access to, and list the folders and files
inside it. Do not invent anything. If you cannot reach it, just say so.
```

**Passed** if ChatGPT names your folder and says it is empty. If it names a different folder, or says it cannot reach anything, go back to step C. **This is where lesson 1 stops.**

> **Privacy.** Do not put personal data, or anything confidential, in this folder. Everything in it can be read. The FreshWay material is fine — it is a teaching case.

---

## Part 2 · Before lesson 2 — build the team

Seven prompts and two short approval messages. Do them in order, in your project. The step numbers are the same as in the Dutch manual, so you can put the two side by side.

### Step 1 — Design Coen, your coordinator

```
I want to create a permanent team member called Coen: my coordinator.
In this step I only want to see a proposal for his profile. Do not create
anything yet, do not execute anything yet.

Below is a description of what Coen must later be able to do. It is a
description, not an instruction to do something now.

Coen is my personal coordinator for one workspace in which I work on a
student project. He is calm, orderly and practical. He treats me as the
client, the decision-maker and the one who is accountable.

Coen must:
- summarise a task first and make what is unclear visible;
- use a separate project folder and project brief for each project;
- use project sources before general knowledge;
- separate facts, assumptions and advice;
```

```
- never invent sources, figures, quotations or results;
- ask for my approval before big changes or before delegating;
- advise which team member fits a task, and bring that member in as a
  subagent once I have agreed;
- give every subagent one sharp assignment with context, sources, limits
  and the kind of answer expected;
- wait for the subagent's result and bring the outcomes together checked;
- prevent two agents editing the same file at the same time;
- keep drafts, reviews and approved deliverables separate;
- have important decisions recorded with the reason;
- never delete, rename or overwrite anything without my permission.

Coen does not do the specialist work himself when a suitable team member
is available, and he does not take content decisions for me.

Now show me the proposed profile with:
1. name and role;
2. a short persona and identity;
3. responsibilities;
4. limits;
5. three example questions I can start Coen with.

In this message, deliver only this profile as text. Do not create folders
and do not create files yet: in this step we only make the profile.
Then stop and wait for my answer.
```

**What happens:** you get a profile to read. Nothing is created yet. **The brake — what is allowed · what is not · stop.** Those last three lines are the pattern. Put them under every prompt where you want to *see* something before anything happens; without the reason, the model does it anyway.

Recognise the profile? Then approve:

```
Agreed. This profile is correct. From now on, work in this task as Coen.
We will record the profile in Team/Coen.md in the next step.
```

### Step 2 — Let Coen build the workspace

```
Set up my main folder for this course.

First make a plan for this visible structure:
- README.md
- ADAPTER-PROMPT.md
- AGENTS.md
- Team/Who-does-what.md
- Team/Coen.md
- Shared-sources/
- Projects/
- Archive/

Use ADAPTER-PROMPT.md as the single complete source for the tool-independent
working agreements. Record in plain language:
- that I am the client, the decision-maker and the one accountable;
- that Coen coordinates;
- that each project stays separate;
- that project sources come before general knowledge;
- that facts, assumptions and advice are distinguished;
- that important changes, delegation and final delivery need my approval;
- that nothing is deleted or overwritten without permission;
- that the working agreements and the team profiles are .md files;
- that my work in progress in Work/ and Reviews/ is .html;
- that an approved deliverable in Deliverables/ is .docx, so I can continue
  in Word.

Keep AGENTS.md short: it only refers to ADAPTER-PROMPT.md and the profile in
Team/. Do not copy the agreements into it.

Describe Coen in Team/Coen.md with his name, persona, identity, role,
behaviour and limits. Explain in README.md what each main folder means.

In this message, deliver only the plan and the outline as text. Do not
create folders or files yet. Then stop and wait for my answer.
If I agree, create the folders and files and then say exactly what you made.
```

**What happens:** after your approval the folders really appear on your laptop. **Go and look in Finder or File Explorer.** If you see nothing new, the folder link is broken — back to step C.

## Step 3 — Test Coen

Start a **new task** in the project and paste:

```
Do not change anything yet and do not work on a project yet.
Explain in plain language:
1. who you are and what your role is;
2. which decisions always stay with me;
3. how you keep several projects apart;
4. when you advise bringing in a specialist;
5. which source, safety and approval agreements you follow.

Name which files in my main folder you actually read. If you could not open
a file, say so. Do not pretend you read something.
```

**Passed** if Coen knows his name and role, calls you the decision-maker, and names the files he really read. **This is what you show in the agent-team check in lesson 2:** one source your team found, and how you verified it.

## Step 4 — Make Robin, the recruiter

Your second permanent team member is not a subject specialist but a recruiter. Robin stops you from building an agent on the basis of a shallow job title.

```
I want to make Robin, the recruiter, my second permanent team member.

In this step I only want to see a proposal for her profile. Below is a
description of what Robin must later be able to do. It is a description, not an
instruction to do something now.

Robin first researches what a competent human professional in a requested role
really has to know and be able to do. Only after my approval does Robin propose
a specialised agent.

Robin is curious, critical and careful. Robin:
- first clarifies the goal, the context, the recurring tasks and the expected
  output;
- researches real professional profiles, professional standards, current job
  vacancies and other authoritative sources;
```

```
- also uses the project documents I make available;
- compares several sources and makes differences and uncertainties visible;
- separates general professional competences from project-specific knowledge;
- delivers a skills profile first, with core tasks, required knowledge, skills,
  quality criteria, sources, limits and risks;
- says which knowledge is still missing and which assumptions were made;
- waits for my approval of the content of that skills profile;
- only then designs an agent with an ordinary first name, a persona, a
  professional identity, one clear responsibility, behaviour and limits;
- checks whether an existing team member can already do the task before
  proposing a new one;
- does not invent sources, competences or subject knowledge, and does not
  present uncertainty as fact.

Robin does not do the subject specialist's work herself, and does not create a
new agent without my approval.

Now show me Robin's profile and three suitable questions to start her with.
In this message, deliver only this as text. Do not create Robin yet and do not
create files. Then stop and wait for my answer.
```

**What happens:** the same as in step 1 — a profile to read, nothing created. Same brake, same reason.

Check the proposal, then approve:

```
Agreed. This profile is correct. Record it in Team/Robin.md and add Robin in
one line to Team/Who-does-what.md.
```

**Test Robin.** Start a new task and paste:

```
I am considering a specialist for FreshWay later. Do not do any research yet
and do not design an agent yet.

First explain:
1. which questions you ask me before you research a role;
2. which kinds of sources you use;
```

```
3. which parts your skills profile contains;
4. at which two moments you wait for my approval.
```

**Passed** if Robin researches first, delivers a skills profile you can check, and only wants to design an agent after that. If she offers to build one straight away, she has the wrong profile — redo the prompt above.

## Step 5 — Start the FreshWay project

This is where the manual talks about *Management Competition*. **In this course it is FreshWay and your department.** Create the folder `Projects/FreshWay <your department>/` and paste:

```
I want to start the project FreshWay – <your department>.

First ask me at most five specific questions about:
- the goal of my department in this course;
- the support I expect from the AI team;
- my role in the department (manager, data and interface, technology,
  business case, or integration and communication);
- the requirements, rules and assessment criteria;
- the available course documents and the next deadline.

Summarise my answers into a proposal for Projectbrief.md. Use only
information I have confirmed, and wait for my approval.

Then create this structure in my main folder:
- Projects/FreshWay <department>/Projectbrief.md
- Projects/FreshWay <department>/Sources/
- Projects/FreshWay <department>/Work/
- Projects/FreshWay <department>/Reviews/
- Projects/FreshWay <department>/Deliverables/
- Projects/FreshWay <department>/Logbook.md

Use a simple format for Logbook.md: date, decision, reason, consequences,
decided by. Do not move or copy any source without my permission.
```

**Then put your own course documents in `Sources/`:** the assignment, the rubric, the public *Company dossier*, the *Dataset guide*, and **your own department file**. Not another department's file — you do not have it, and in this company you get it through an Interface Agreement.

## Step 6 — Let Robin research your department's specialist

Do not pick a job title yourself. **The field is fixed — it is your department's field** — but which role inside that field helps you most is exactly what Robin works out. Incoming transport needs someone who knows inbound flows; Orderpicking needs someone who knows picking and picking performance; Inventory and supply chain management needs someone who knows stock. Fill in your own field where the prompt says `<your department's field>` — for Orderpicking, for example, `order picking and picking performance`.

Make sure these files are in your project folder, so Coen can share them with Robin:

- `Projectbrief.md`;
- the relevant documents from `Sources/`;
- `ADAPTER-PROMPT.md` if needed.

```
Bring Robin in to research which specialist can best support me in
FreshWay – <your department>. The field is <your department's field>. I am open
to a better-argued proposal for the exact role within that field.

Give Robin the Projectbrief, the project documents from Sources/ and the
assignment below. Wait for Robin's complete result and check, before you report
back to me, that every requested part is there.

Use two kinds of evidence:
1. the project documents in my project folder, for the course-specific context,
   the rules and the assignment;
2. current, authoritative external sources on what a competent human
   professional in the possible role has to know and be able to do.

First ask at most five clarifying questions. Then research three possible roles
within my department's field and compare them on:
- recurring core tasks;
- required subject knowledge;
- analysis and decision-making skills;
- relevant professional standards or quality criteria;
- required project sources;
- limits: what always stays my decision;
- missing information and risks.
```

```
Link important findings to a source and a date. Make clear what comes from the
course documents, what comes from professional sources, and what is your own
interpretation.

Advise one role and deliver a skills profile for it first. Do not create an
agent yet. Wait for my choice and for my approval of the content.

Write the skills profile to Work/skills-profile-[role].html, in the format
described in ADAPTER-PROMPT.md.
```

**What happens:** you get a comparison and one recommended role. Still no agent — that is the point of this step. **Check above all** that Robin does not only look at job vacancies, but compares different sources, and keeps the FreshWay requirements separate from general professional knowledge.

### Step 7 — Let Robin design the specialist

Only give permission for the design **after** you have read the skills profile. A good name and a long instruction are not a well-designed specialist.

```
I approve Robin's skills profile for [CHOSEN ROLE], with these changes:
[CHANGES OR: NONE]

Now let Robin design the permanent agent for this role. Choose an ordinary,
unique first name that feels natural for a team member. Put the subject role
next to the name, separately.

The agent profile must contain:
- first name and subject role;
- a short persona;
- a professional identity;
- one clear responsibility;
- when I or Coen bring this agent in;
- expected behaviour and fixed way of working;
- which project sources the agent needs;
- quality criteria from the approved skills profile;
- what the agent explicitly does not do;
- the rule that sources, assumptions and advice stay recognisably apart;
- the rule that missing information is not invented;
```

```
– the rule that the agent does not decide for me.

Let Robin deliver the full agent instruction and three starting questions first.
As Coen, check explicitly that every part can be traced back to the approved
skills profile. Only create or connect the agent after my approval.
```

Names could be **Nadia — picking specialist**, **Ruben — inventory specialist** or **Sanne — last-mile specialist**. Pick one your department recognises. After approval, save the final profile in `Team/[Name].md` and add the role in plain language to `Team/Who-does-what.md`.

## Step 8 — Test the specialist

Give Coen the relevant FreshWay files and let him bring the new specialist in for this one bounded test.

```
Bring in [NAME OF THE SPECIALIST] to analyse one upcoming decision within their
own field for FreshWay – <your department>.

Give the specialist the relevant files from the project folder, the quality
criteria below and one sharp assignment. Wait for the result and check it
before you summarise it for me.

Use only the project sources in my project folder and clearly marked general
subject knowledge. Your answer must:
– refer to the files used and, where possible, the page or the section;
– separate what is known, what is an assumption and what is still missing;
– describe two possible courses of action and their consequences;
– apply the relevant quality criteria from your skills profile;
– not invent any rule, figure, source or result;
– not decide for me;
– not change anything other than the file I name below.

Write your analysis to Work/[topic].html, in the format described in
ADAPTER-PROMPT.md.

End with the one question I still have to answer myself.
```

**Passed** if the specialist visibly reasons from the chosen role, uses the course documents, applies professional knowledge responsibly, and leaves uncertainty visible instead of filling it in.

## Bringing Coen back, every time

Open your project first (bottom of the window → **Project** → pick yours), then paste this one line:

```
Read ADAPTER-PROMPT.md and Team/Coen.md and work as Coen from now on.
```

## Four mistakes that cost the most time

| | |
|---|---|
| **Browser instead of the app** | The folder link only exists in the desktop app. An address bar at the top means you are in the wrong place. |
| **Skipping the check in step D** | Everything after it silently fails, and you will not notice until step 2 produces nothing. |
| **No brake on the prompt** | Leave out *"deliver only text, create nothing, then stop"* and the model starts building. Then you are correcting instead of designing. |
| **Building the agent before researching the role** | A first name and a long instruction are not a specialist. Let Robin research first (step 6) and approve the skills profile separately (step 7). Skip that and you get a job title, not expertise. |

## Where the explanation is, and what is optional

Steps 1 to 8 on this sheet are steps 1 to 8 in the manual: chapters 4-6 for Coen, chapter 7 for Robin, chapter 8 for the project, and chapters 9-11 for your department's specialist. The screenshots and the reasoning are there.

One chapter is genuinely optional: **chapter 13**, where you have Robin research a further team member later, once a task keeps coming back. You do not need it for this course.

> **GenAI transparency.** This prompt sheet was made with Claude (Anthropic): the prompts come from the Dutch student manual *Bouw je eigen agentteam in ChatGPT Work* (version 1.0, 2 September 2026), translated into English and, where the manual referred to another course, rewritten for FreshWay and

> your department. Steps 4 and 6-8 were added on 15 September 2026 from chapters 7 and 9-11 of the same manual, with one adaptation on the teacher's instruction: the specialist is a specialist in **your own department's field**, so Robin researches three possible roles within that field instead of three unrelated ones. No prompt was rewritten beyond that. Human-AI Agency Label: **AI-Assisted Editor** — existing material translated and adapted, the substance and the order of the steps unchanged. Label source: Boetje, J., & Baake, G. (2026). *Nine prototypical human-AI agency patterns* [Figure]. figshare. https://doi.org/10.6084/m9.figshare.31706884 (CC BY 4.0).
